

**Honolulu High-Capacity Transit Corridor Project  
Alternatives Analysis**

**Travel Demand Forecasting Results Report**

**October 2008**

Prepared for:  
City and County of Honolulu  
Prepared by:  
Parsons Brinckerhoff

**CHAPTER 1 BACKGROUND..... 1-1**

1.1 Overview of the O’ahuMPO Travel Demand Model System..... 1-1

1.2 Travel Model Background and Refinements..... 1-2

1.2.1 Changes to the Existing O’ahuMPO Model..... 1-2

1.3 New Starts Methodology Considerations..... 1-5

1.3.1 Fixed Person Trip and Highway Travel Time Matrices..... 1-5

1.3.2 TSM versus Baseline..... 1-5

**CHAPTER 2 TRANSIT SERVICE LEVEL IMPACTS OF THE ALTERNATIVES ..... 2-1**

2.1 No Build..... 2-1

2.1.1 Mode Share ..... 2-1

2.1.2 Auto and Transit Travel Times..... 2-1

2.2 Transportation System Management ..... 2-5

2.2.1 Mode Share ..... 2-5

2.2.2 Transit Travel Times ..... 2-5

2.3 Fixed Guideway Salt Lake, Airport, & Airport & Salt Lake – First Project..... 2-5

2.3.1 Mode Share ..... 2-5

2.3.2 Auto and Transit Travel Times..... 2-5

2.4 Fixed Guideway Salt Lake, Airport, & Airport & Salt Lake – Full Project ..... 2-5

2.4.1 Mode Share ..... 2-5

2.4.2 Transit Travel Times ..... 2-5

**CHAPTER 3 RIDERSHIP IMPACTS OF THE ALTERNATIVE..... 3-1**

3.1 Transit Trips by Time of Day ..... 3-1

3.2 Transit Trips by Trip Purpose ..... 3-1

3.3 Transit Trips by Auto Ownership Level..... 3-2

3.4 Transit Trip Differences: No-Build versus TSM Alternative..... 3-3

3.5 Transit Trip Differences: No-Build versus Fixed Guideway First Project Salt Lake Alternative..... 3-3

3.6 Transit Trip Differences: No-Build versus Fixed Guideway First Project Airport Alternative..... 3-4

3.7 Transit Trip Differences: No-Build versus Fixed Guideway Alternative First Project Airport & Salt Lake Alternative ..... 3-4

3.8 Transit Trip Differences: No-Build versus Fixed Guideway Alternative Full Project Salt Lake Alternative ..... 3-4

3.9 Transit Trip Differences: No-Build versus Fixed Guideway Alternative Full Project Airport Alternative..... 3-5

3.10 Transit Trip Differences: No-Build versus Fixed Guideway Alternative Full Project Airport & Salt Lake Alternative ..... 3-5

**CHAPTER 4 RIDERSHIP ON TRANSIT FACILITIES ..... 4-1**

4.1 Transit Line Volumes ..... 4-1

4.2 Station Volumes by Access Modes..... 4-1

4.3 Fixed Guideway Link Volumes..... 4-1

4.4 Station-to-Station Volumes ..... 4-2

## ***Acronyms and Abbreviations***

---

CTPP	Census Transportation Planning Package
EIS	Environmental Impact Statement
FTA	U.S. Department of Transportation Federal Transit Administration
HOV	High-occupancy Vehicle
KNR	Kiss-and-Ride
mph	Miles per hour
O'ahuMPO	O'ahu Metropolitan Planning Organization
PNR	Park-and-Ride
RTD	City and County of Honolulu Department of Transportation Services Rapid Transit Division
TSM	Transportation System Management
UH	University of Hawai'i

This report presents the technical raw model results of the travel forecasting analysis conducted for the Honolulu High-Capacity Transit Corridor Project (the Project). The travel forecasting was conducted using the O'ahu Metropolitan Planning Organization's (O'ahuMPO) base model for the Island of O'ahu. The model was reviewed, enhanced, and recalibrated for this Project. A fixed distribution of person trips and highway travel time matrices were used for all alternatives in this analysis, with the projected transit mode share being the resulting distinctive output from the model. Eight alternatives were evaluated and presented in the *Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement* (RTD 2008).

Three primary alternatives were considered. The No Build Alternative includes programming highway and transit improvements through the year 2030. The Transportation System Management (TSM) Alternative includes a restructuring of the bus network, additional bus service, and relatively low-cost improvements to transit service. The Fixed Guideway Alternatives that are presented in this report include the three 20-mile alignment alternatives (First Project) and the three First Project plus Future Extensions alignment alternatives (Full Project) that were presented in the Draft Environmental Impact Statement (Draft EIS) for the Project.

The model review, enhancement, and recalibration focused on several specific features. The transit network, the transit travel time function, and the path building parameters were updated and the highway component was enhanced by improving the travel speed representation and revising the volume-delay functions in the model. The Home-Based Work Person Trip matrix was validated against the 2000 Census Transportation Planning Package (CTPP) to improve the accuracy of the matrix. The mode choice model was also updated and recalibrated to improve accuracy of the model coefficients and relationships and to calibrate the alternative-specific constants.

The results of the analysis illustrate that the greatest improvements to the transit system result from the Fixed Guideway Alternatives. In regard to serving existing and future transit markets, the Fixed Guideway Alternatives do the best job in accommodating both longer corridor transit trips and the increase in work commute trips to West O'ahu, which is expected to become much more pronounced in the future. In comparison to the No Build Alternative, daily transit trips are projected to increase by 20 to 21 percent for the First Project Fixed Guideway Alternatives and 24 to 25 percent for the Full Project, while the projected increase for the TSM Alternative is 6 percent. The results also indicate that in comparison to all other alternatives, the Fixed Guideway Alternatives attract substantially more transit riders from households that have one or more private automobiles.

In addition, the Fixed Guideway Alternatives most consistently result in improved transit travel times between key corridor origins and destinations. In many cases, these travel times are equivalent to, or faster than, the same trip time made by private vehicle under No Build conditions, especially when considering the use of park-and-ride trips.

1.1 Overview of the O’ahuMPO Travel Demand Model System

The O’ahuMPO’s “best-practice” models have adopted the general structure that has been used for several decades for urban travel models in the United States. A vast majority of model sets that have been developed recently in several urban areas has continued to use this “sequential” approach to travel forecasting in which travel patterns are assumed to be the product of a sequence of individual decisions:

- The number of trips that a household will make – “trip generation”
- The destinations of these trips – “trip distribution”
- The modes that will be used for travel – “mode choice”
- The paths on the network that the trips will take – “network assignment”

The various travel models used by O’ahuMPO are described in the *Guide to Model Form*, included within the *Final Documentation* for the Travel Forecasting Model Development Project of the O’ahu Metropolitan Planning Organization, December 17, 2002.

Figure 1-1 shows the sequence of model procedures of the current O’ahuMPO models. Currently the model produces an AM peak 2-hour transit assignment. To determine the AM peak hour assignment, a factor of 55% was used, which was derived from the 1995 Home-Interview Survey.

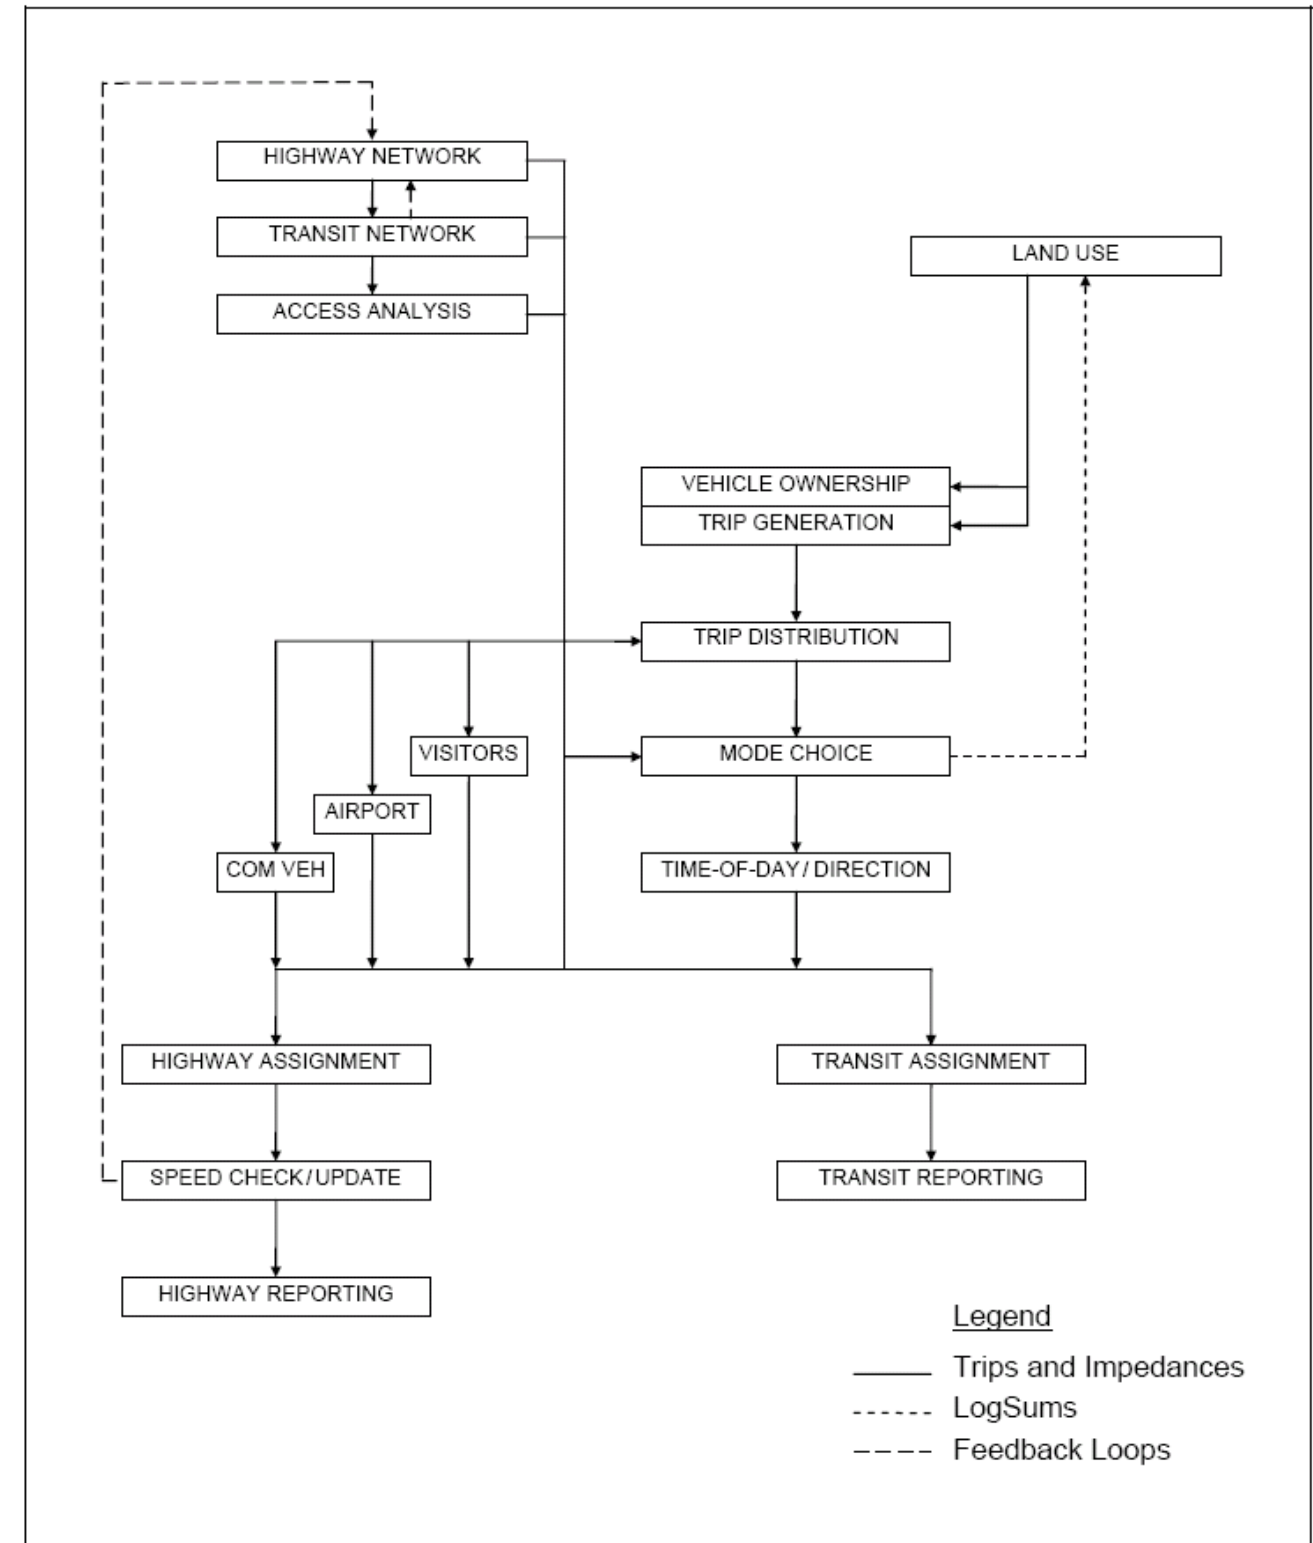

Figure 1-1: O’ahuMPO General Model Procedures Flow Diagram

## 1.2 Travel Model Background and Refinements

### 1.2.1 Changes to the Existing O'ahuMPO Model

The following activities were undertaken as part of the review, enhancement, and recalibration of the existing models. They have been grouped into categories to make them easier to discuss. Brief summaries of each change are included in this report.

- Data Analysis and Comparisons
  - Ala Moana Center On-board Survey Analysis
  - Transit On-board Survey Analysis
  - Auto ownership versus CTPP comparison
  - Analysis of Highway Travel Times
- Refinement of Model Purposes
  - Revision of home-based school (K-12) and home-based college distribution
  - Update of visitor model
- Mode Choice Adjustments
  - Adjustment of Mode Choice Model
  - Implementation of New Spillover Parking Process
  - San Diego Method for Kiss-and-Ride and Park-and-Ride
- Update to Walk Access Links Process
  - Drivelinks Revisions
  - Manual Adjustment of Walk Access Links
  - MINUTP Access Link Limitations
- Other
  - Volume delay functions
  - Changed zone and district system to 764 and 26
  - Land use changes
  - Non-home-based direct demand model – calibration and development
  - Calibration and validation

#### Data Analysis and Comparisons

##### Ala Moana Center On-board Survey Analysis

The Federal Transit Administration (FTA) voiced concern over the increase in trips to Ala Moana Center. In particular, there was concern that the 2005 on-board survey showed a higher percentage of trips (20 percent) to the Ala Moana Center zone than in the previous 1992 on-board survey (16 percent). The Ala Moana Center zone attracted 11 percent of the transit trips as opposed to 7 percent in 1992. Moreover, the 2005 on-board survey showed a lower percentage of trips (6 percent) to the Waikiki district than the previous 1992 on-board survey (10 percent). Downtown also showed a lower percentage of transit trips (21 percent) compared to the 1992 survey (26 percent). This caused some concerns that the 2005 survey results had been tabulated incorrectly or

that passenger responses were not actually destinations at Ala Moana Center but instead transfers from other buses at Ala Moana Center.

A review of the survey data indicated some invalid destinations at Ala Moana Center and the data were revised to resolve these issues. It was determined that the trip rates to Ala Moana Center should be higher than the 1992 survey but should not be as high as the survey reported and was used in the model. These errors were corrected and a rate lower than the 2005 survey was used to re-expand the survey data and re-calibrate mode choice.

##### Transit On Board Survey Analysis

The re-expansion of the survey results could change the transit assignment in the model. The 2005 on-board survey was re-assigned to ensure that the new expansion did not affect the results of the transit assignment. The observed transit trip tables by time period, mode, and mode of access were assigned to the transit networks and comparisons of estimated versus reported boardings by period, mode, and mode of access were used to validate transit networks. The on-board assignment showed that the 230,062 assigned boardings matched with 97 percent of the observed expanded boardings. The 91 percent coefficient of determination ( $R^2$ ) between the assigned boardings and the observed boardings shows an excellent fit and the transfer penalty and path parameters reflect the observed data. Individual routes were overestimated when compared to the observed but this was due to competing routes along corridors. The overall corridor ridership accurately reflected the observed data and the assignment did not need to be adjusted.

##### Auto-ownership versus CTPP Comparison

The O'ahuMPO Auto Ownership model was compared to Census data to determine the degree of model fit in the base year. The analysis revealed that the model was under-estimating zero auto households and over-estimating three+ auto households. It was determined that estimated versus observed households by income and workers per household, which are input to the auto ownership model, were not matching Census data and may have been adversely affecting the auto ownership model results. Based on these findings, the Auto Ownership model was re-calibrated and included new alternative-specific constants and verification of the Trip Distribution of the model.

##### Analysis of Highway Travel Time by Traffic Group

There was concern about the effect that the model speeds had on the forecasting results. Speed/travel time data were acquired for eight corridors in the O'ahu area. The congested speeds from the travel demand model were compared with the actual travel times on specific paths in O'ahu. The collected travel time data focused mainly on freeway segments. Each segment of the route in the travel time study was matched with a corresponding link on the travel demand model network to compare the speed results. As a general conclusion, the freeway speeds from the travel demand model were determined to be higher than the actual observed travel times on an average of 12-25 miles per hour (mph) depending on the corridor. These higher speeds could affect the transit ridership of the model in both the base year and future. Origin/Destination

estimation techniques were tested but did not produce reliable enough results to change the model speeds in the Draft EIS. In the future, a new estimation technique will be applied using actual ground counts to assist in the adjustment of the assigned traffic and model speeds.

### **Refinement of Model Purposes**

#### **Revision of Home-based School (K-12) and Home-based College Distribution**

The K-12 and University purposes were identified as producing higher user benefits than anticipated and adding unanticipated rail riders. Detailed analysis of the K-12 trip generation model shows that it estimates productions by zone and then normalizes attractions to productions. The model was globally increasing attractions at each school site resulting in a significant number of fixed-guideway riders and user benefits from the 'Ewa districts to Salt Lake (most notably) and beyond. Since the 'Ewa side of the island did not have schools to allocate the students to, they were forced to make longer trips and produced school flow patterns that were not logical. Manual adjustments were made to the school locations and number of students (primarily in the 'Ewa districts) to more reasonably reflect expected development patterns and known locations for future school sites. The end result was a considerably more logical pattern of ridership and user benefits. The K-12 benefits were reduced by 42 percent, or nearly 2,000 hours.

The magnitude of the University benefits to UH Mānoa were a concern as well because of all of the students on the western side of the island commuting by rail to the UH campus. The growth for UH is modest over the 25-year span, but the addition of the West O'ahu campus will affect the distribution of trips and the overall student commuting pattern. The University person trip distribution was manually adjusted to match the student residencies by district. The manual adjustment resulted in a 13 percent decrease in user benefits and a more logical distribution of college trips in O'ahu.

#### **Update of Visitor Model**

The original visitor model for O'ahu was based on 1991 visitor survey data. The visitor model was updated to reflect land use changes on O'ahu and the update of the travel model to a 2005 base year.

The visitor model was re-calibrated based on the distribution of trips by mode and destination from the original model development. They were scaled up from 1991 to 2005 based on the increase in visitors as reported by the Hawai'i Department of Business, Economic Development, and Tourism. The model land use data reflect no hotel room growth since 1991 but seem to contradict the Hawai'i State data that indicate visitors to O'ahu increased by 19 percent over this period. To compensate for the imbalance, higher destination constants were used so that the correct number of trips was generated.

The model under-estimated walk trips in Waikīkī, and over-estimated both walk and tour bus trips to Ala Moana Center. An intra-Waikīkī constant was added to better match both intra-Waikīkī walk trips and reduce walk trips to Ala Moana Center. An additional

Ala Moana Center walk constant and tour bus constant were incorporated in the model to obtain the correct mode shares for visitors.

The technical report shows that 2005 visitor trips by mode and destination now match the observed data, including bus trips to Ala Moana Center.

### **Mode Choice Adjustments**

#### **Adjustment of Mode Choice Model**

The mode choice model was re-calibrated as part of the Draft EIS process; however, the details of it are not discussed in this report. There are other adjustments that were made to the mode choice model and they are discussed briefly in the list below:

- Short transit trip penalty – A transit distance penalty for short transit trips was introduced so that people were less likely to take short transit trips.
- District Specific Constants – Transit trips to Downtown were under-estimated by 23 percent and transit trips to Ala Moana Center were under-estimated by 54 percent. Most of this was due to the under-estimation of home-based other trips. Therefore, attraction district constants for district 26 (Ala Moana Center) and production constants for district 4 (Waikīkī) were added to the mode choice model, as well as a set of production and attraction district factors for the Central Business District. The factors are specified at the multinomial level and scaled appropriately in the mode choice program; they are applied to all transit modes.
- Toll changes – Incorporated the Nimitz flyover toll options from the previous work by implementing the CLSTollIDA and CLSTollSR nesting coefficients, set the toll time savings and distance parameters to zero, and set the toll cost to the asserted values from the Nimitz flyover work. The Kocc3 constant was scaled to compensate for the changed nesting coefficients so that the model replicates the previously calibrated shared 2 and 3+ shares.
- Noprem option – There was a parameter called noprem that turns off premium transit. We created two more options – nopnr and noknr – that can be turned off to prevent drive-transit trips for some particular purpose. The old parameter now only controls premium walk-access trips.
- Trip table scaling – A parameter called Scale was added that controls the precision of the output trip tables. Scale can be set to any integer number (e.g., 1, 10, 100).

#### **Implementation of New Informal Park-and-Ride & Kiss-and-Ride Process**

The original O'ahu mode choice model structure did not allow competition between formal and informal lots; if a zone was connected to a formal lot, it assumed that all park-and-ride (PNR) trips would use that lot, while only zones that were unconnected to a formal lot were allowed to consider parking at an informal lot. Since there was no competition in the mode choice model between formal and informal PNR lots, it was suspected that the informal PNR constant was becoming more positive as it attempted to compensate for the lack of informal market share.

Therefore the model was extended to reflect the choice between formal and informal PNR. The nesting coefficient for the PNR choice nest is 0.75. The informal lot utility is based on the kiss-and-ride (KNR) skim, which is basically the best walk-transit path, but with drive time substituting for walk access time on the production end of the trip. In order to prevent identification problems between formal PNR and informal PNR (which could happen when the KNR lot is the same as the PNR lot), the informal PNR lot choice is turned off when the formal and informal PNR skimmed in-vehicle time, first wait, and transfer wait times are the same.

The KNR process also needed to be addressed because all the KNR trips were being assigned to walk-to-transit paths. In addition, the KNR skim was set to formal PNR skim in cases where there is a valid walk path and no formal PNR path (i.e., KNR is turned off for interchanges where formal PNR is not available).

The first issue was addressed by sorting all KNR and informal PNR trip tables into one of two bins – either a walk-converted-to-drive bin or a formal PNR bin, based on which path was selected for the KNR skims. The walk-converted-to-drive bin was assigned to the walk network. The formal PNR bin trips were assigned to the formal PNR networks. The skimming process for KNR was changed to allow KNR anywhere there is a valid path, not just a formal PNR path.

#### **Adjustment of KNR/PNR Trips by Purpose (San Diego Method)**

The model was producing total PNR and KNR trips correctly to rail, but the split of those trips in mode choice was overwhelmingly favoring KNR to rail. For Honolulu, there was no data to suggest the proper split of these trips to rail since rail does not exist. Percentages by trip purpose from a survey of the San Diego rail line were used to adjust trips in mode choice so that the correct proportion of trips were made to KNR and PNR by the varying auto ownership levels. A set of new constants by auto ownership was calibrated for mode choice and applied in one iteration to the end of the mode choice model.

This adjustment brought KNR to rail from 21,034 trips (.6 percent) to 12,228 trips (.4 percent) overall. The PNR for the work purpose went from 3,500 trips to 9,500 trips and produced better access into the individual rail stations.

#### **Update to Walk Access Links Process**

##### **Drivelinks Revisions**

The model uses a program to determine drive access links (DRVLINKS). The program determines the zones that are within a specified distance (5 miles originally) to PNR locations and generates a list of potential access links that satisfy that distance. It provides access to an unlimited number of connections to PNR locations and allowed people to travel long distances, thus passing closer PNR locations. The list of generated access links was also placed in a sorted list by station node number. Therefore if a zone was only allowed three drive links it took the first three links in the list or the links that had the lowest station number, which doesn't correlate to the shortest links that a zone may have access to. Therefore, people wanting to PNR may have had to travel a longer path due to this limitation, when in fact closer locations existed. The drivelink process

did not allow for informal PNR access either. On O'ahu, a number of transit riders park in neighborhoods and businesses, creating informal PNR locations, but the drivelinks program did not allow this option.

Another issue concerned the PNR text file that is created to allow MINUTP to create the access links to the stations (bus and rail). The drivelinks program output a file that listed a range of zones for MINUTP to use, such as zone 1-764. The program cannot handle ranges that large because of memory limitations and it forces the program to shut down. Previously a smaller range, 1-120, had to be manually inserted into this file so that it could operate. That also does not show exactly which zones have access to the correct station locations.

Several changes were made to alleviate the drive access issues.

- Drive access length – increased from 5 miles to 8 miles. Survey suggested people were driving more than 5 miles on average, so it was changed.
- Max Station/Max Bus option – allows zones to only connect to limited bus and rail stations instead of allowing people to drive long unrealistic distances to PNR formally/informally. Selects the best/shortest options for connections. For informal PNR, the limits were set to maxstations=4 and max bus=3 so the alternatives would be comparable.
- Access list sort – sorted by shortest distance so that the proper links were chosen when connections are limited.
- Informal PNR/KNR implementation – created process to allow informal parking/KNR at any bus transit location.
- A newer version of the program to write the MINUTP station file so that only zones that fall into the distance threshold were included in the station file.

##### **Manual Adjustment of Walk Access Links**

The program used to generate the walk access to transit links (ACCLINK) uses a weighting procedure to determine which nodes on the network have the best transit access. It then attaches walk access links from each zone to the nodes that have the best service. There is a limit on the links it can connect to from each zone. This is an intelligent way to ensure the best links are used for transit service access. The service frequency along routes is the main indicator of which nodes to connect walk access links.

One unintended problem with the method was discovered when comparing the TSM and Build Alternatives. The Build Alternative was getting large amounts of negative benefits between zone pairs that were relatively close, 20-30 minutes walking time. In this alternative, the fixed guideway system crossed at a particular node and/or some slight route change made that node connected by walk links. Both zones then connected to that node and allowed people to walk through that node to get between the zone pair because it was slightly faster than the transit alternative. However, in the TSM Alternative that particular node was not scored high and therefore not connected

with a walk through link. In the TSM Alternative, zone pairs used a transit path, but a transit path was not used in the Build Alternative so it resulted in negative benefits.

Instances such as this had to be manually adjusted in either the TSM or Build Alternative to ensure that the same walk through occurred in both alternatives. A list of common occurring walk connections was created and inserted into the walklink file.

#### **MINUTP Access Link Limitations**

MINUTP builds the walk access links during the skimming process. However, due to memory limitation it can only handle a certain number of access links. The KNR skimming process (which determines the informal PNR) created a lot of links because most of the transit nodes were available for walk access connection. The memory issue in MINUTP forced the program to shut down when it had too many possible access connections from each zone. To ensure consistent operation and output from the model for each alternative, the number of walk access connections to express bus and limited stop was reduced from 6 to 5 in the KNR skims.

#### **Other**

##### **Volume Delay Functions**

The volume delay functions were changed to conical functions in the Alternative Analysis phase. However, some of the facility types were not specified correctly in the new volume delay function. The facility types for Class II collectors (7), ramps (9, 10) and locals were corrected to reflect the proper equations for the volume delay functions.

##### **Transportation Analysis Zone and District Change**

The model had a 762 zone system and 25 district system. The zone system was increased to 764 zones. Zone 762 was split to better represent UH West O'ahu campus in the future. Zone 600 was split to provide the correct roadway access in the Ho'opili area because the zone coverage was too large. A few adjustments to zone boundaries were made as well. None of these changes affected the control totals for the model.

The district system was increased from 25 to 26 districts so that Ala Moana Shopping Center was its own district. This allowed for easier analysis of the trips, boardings, and benefits directly related to Ala Moana Center.

##### **Land Use Changes**

The allocation of the land use changed substantially from the May 2005 Alternative Analysis submittal. Although, the control totals remained consistent, the distribution of the employment and households changed for various reasons. Military employment was reallocated among the proper zones and visitor and residential units in Waikīkī decreased in the 2005 base year. Future changes carried these trends forward but also allowed for the City's policy change in allowing more residential development in Waiawa and Mililani and less in 'Ewa/Kapolei. The new land use changes also added more employment in Kalihi and Kapolei and less in Salt Lake.

#### **Non-home Based Direct Demand Model Calibration and Development**

The Non-home Based Direct Demand model was developed in 1989 and it estimates the number of non-home-based trip ends at each rail station. The factors for the model are based on the density of employment within one-half mile of the station – and are inversely related to density. The model works by first determining which Transportation Analysis Zones are within one-half mile of each station and computing the station density. Then the model selects a factor for each station and applies it to Home-Based alightings at the station (it is necessary to assign a Home-Based rail trip table to the transit network and add up the alightings at each station) to estimate non-home-based trip ends. Then a trip distribution model was applied to convert the trip ends to trips and assign the non-home-based trip table as well.

The model was updated and re-estimated using 2002 data before being applied in Honolulu for the Draft EIS. A destination choice trip distribution model was also added to create a station-to-station matrix for rail. In addition, a Java program was added to the non-home-based direct demand model to be able to calculate the user benefits for these trips.

#### **Model Calibration and Validation**

The 2005 model was calibrated as a result of all of the changes discussed. Calibration Target Values were assigned and applied to the model. Details regarding the calibration and validation process, including the specific Calibration Target Values, can be found in the *Honolulu High-Capacity Transit Corridor Project Travel Forecasting Methodology Report* (RTD 2006).

### **1.3 New Starts Methodology Considerations**

#### **1.3.1 Fixed Person Trip and Highway Travel Time Matrices**

In compliance with FTA guidance, land use, person trip, and highway travel time matrices were fixed throughout the analysis of all alternatives. The land use data, person trip distribution, and roadway travel times remain the same among alternatives. Changes to the transit service representative of each alternative caused changes in transit travel times that resulted in varied results in the mode choice model, thus providing mode share differences for each alternative.

#### **1.3.2 TSM versus Baseline**

The TSM Alternative used in this analysis was not intended to serve as the official FTA Baseline. The baseline alternative must be defined within the context of the Locally Preferred Alternative, which is the focus of the Alternatives Analysis study. The Build Alternatives, including the TSM Alternative, were compared against the No Build Alternative for purposes of the Alternatives Analysis study. In some cases, the Build Alternatives were also compared against the TSM Alternative as it is defined here.

Each alternative has a specific effect on the performance of the transit system. Mode share and transit travel time are two particular measures used to assess the improvement of transit service. Both measures provide indications of how well an alternative improves transit service.

The mode share measure presents the numbers and relative percentages of people who choose a specific mode of transportation for all trips made throughout the day (Tables 2-1 and 2-2) and for home-based trips to work (Table 2-3). If the number of transit trips (or if the transit mode share) increases, that is an indication that the transit system is providing a high enough level of service to entice people to use transit rather than other modes, such as private automobiles, walking, or bicycling. Therefore, an increase in transit mode share is an indication that the transit system is performing better as compared to the No Build Alternative.

Transit travel time is another measure related to transit performance. Table 2-4 shows the future estimated a.m. two-hour peak-period (6:00 a.m. to 8:00 a.m.) transit travel times between 19 selected study corridor location pairs for the TSM and each Fixed Guideway Alternative. For added context, estimated auto travel times for the existing year 2007 and 2030 No Build and Build Alternatives are also presented. The locations of the origins and destinations comprising the travel routes for which times are estimated are shown in Figure 2-1.

Transit travel time measures the amount of time required to complete a journey from origin to destination, assuming that the journey was made on the transit system. For this analysis, the transit travel time is expressed in two modes: walk-to-transit and drive-to-transit. Walk-to-transit time represents the time needed to complete a transit trip, including time spent walking to and from the transit stop. Drive-to-transit represents the time needed to complete a trip by transit, including time spent driving to the transit stop. While both modes represent the transit trip, the distinction between the two is the mode of access to transit. Walk-to-transit is applicable to all zone pairs across each alternative. The drive-to-transit access mode is only applicable for trips where a park-and-ride facility is available and using it provides a travel-time savings over the walk-to-transit mode, not necessarily for each zone pair or alternative.

The travel times were obtained from the travel demand forecasting model. Existing travel times estimated by the model were compared to observed travel times, and adjustments were made to the model estimates to bring them in line with observed values. In places where bottlenecks are known to exist in the system, the congested speeds calculated by the model were extended to match the length of known traffic queues. Additionally, speeds on the managed lanes were adjusted so as to maintain a minimum speed of 50 mph through the facility (excluding the access and egress points).

The 19 travel pairs correspond to a variety of travel purposes (home-based work, home-based other, and visitor trips) and locations (Wai'anae, Mililani Mauka, 'Ewa, Downtown, UH Mānoa, and Waikīkī). Several pairings represent travel from emerging residential areas such as 'Ewa and Kapolei to key employment destinations such as Downtown.

Home-based other trips are represented by destinations such as UH Mānoa, the terminus of the Full Project alternatives. Visitor trips are reflected in the Airport to Waikīkī pairing. Ala Moana Center is the State's largest shopping complex and thus a popular destination for both visitors and residents. Waipahu is generally a transit-dependent area with many residents traveling to Waikīkī for employment. In addition, travel times for reverse commutes are shown for Downtown to Kapolei.

### 2.1 No Build

#### 2.1.1 Mode Share

As compared to year 2007, total systemwide daily person trips are projected to increase by about 22 percent for the No Build Alternative in 2030, keeping pace with the projected growth in population between 2007 and 2030. Transit mode share for total daily trips is projected to remain at 6 percent (Table 2-1) while transit mode share for home-based work trips is expected to increase from 12.3 to 12.7 percent (Table 2-3). The enhancement of the HOV and zipper-lane systems provides some additional benefits, and hence, attractiveness, to the transit mode.

#### 2.1.2 Auto and Transit Travel Times

As shown in Table 2-4, auto travel times for the No Build Alternative are generally the same as existing conditions between the origins and destinations selected, despite the fact that the No Build Alternative includes \$3 billion of roadway improvements that are included in the O'ahu Regional Transportation Plan 2030. Minor improvements in auto travel times occur between Wai'anae to Downtown, Downtown to Ala Moana Center, and Salt Lake to Downtown. Auto travel times are longer for trips originating from Waipahu, 'Ewa, and Kapolei.

The No Build Alternative results in longer travel times for transit trips for several of the selected pairs, such as 'Ewa to Salt Lake, which is 12 minutes longer under the 2030 No Build Alternative. Some transit travel times, such as from Waianae to Downtown and from Mililani Mauka to Downtown, are projected to improve under the 2030 No Build Alternative. This is because these trips are able to take advantage of the extended HOV lanes on Interstate Route H-1; the improved operations of the zipper lane, which is assumed to be limited to three or more occupant vehicles by the year 2030; and/or the proposed Nimitz flyover, which will give priority to HOVs and transit vehicles. Additionally, the transit travel time from Mililani Mauka to Downtown improves because it is assumed that bus service will be extended farther into the neighborhood, hence shortening walk access time.

**Table 2-1. Total Daily Person Trips by Mode—2007 and 2030 No Build Alternative**

Alternative	2007		2030 No Build		Percentage Growth

N/M = Not Modeled, N/A = Not Applicable

\* A drive to transit trip indicates a trip where the transit user drove to a park-and-ride lot to access transit

Figure 2-1: Locations of Origins and Destinations for Selected Travel Time Routes

## 2.2 Transportation System Management

### 2.2.1 Mode Share

As shown in Tables 2-2 and 2-3, the TSM Alternative, as a result of its enhanced bus service, results in a slightly higher transit mode share than the No Build Alternative, at 6.2 percent as compared to 5.8 percent (daily trips) and 13.7 percent compared to 12.7 percent (home-based work trips). Private vehicle trips and non-motorized trips are projected to decrease slightly in comparison to the No Build Alternative as more people are attracted to transit.

### 2.2.2 Transit Travel Times

Transit travel times for the year 2030 TSM Alternative are expected to generally improve over the No Build Alternative (Table 2-4). In most cases, the savings are due to the higher frequency of service and the shorter wait times for riders. Some locations, such as Mililani Mauka to Downtown, experience larger travel-time benefits as a result of new express routes added for this alternative. The TSM Alternative also has a number of additional park-and-ride lots, and travel times would improve for riders using these lots. Transit travel time worsens between several pairings, such as from 'Ewa to Salt Lake and from Kapolei to Downtown.

In general, travel-time benefits are moderate at best for the TSM Alternative as compared to the No Build. Table 2-4 shows that even by optimizing the bus system, only a marginal benefit in travel time would be gained because more buses on the road would not improve travel times in a majority of cases.

## 2.3 Fixed Guideway Salt Lake, Airport, and Airport & Salt Lake – First Project

### 2.3.1 Mode Share

All of the First Project Fixed Guideway Alternatives are expected to experience higher systemwide daily transit ridership and mode share in comparison with all of the other alternatives, as shown in Table 2-2. The three First Project Alternatives are expected to result in transit mode shares of 7.0 percent for daily trips and up to 16.6 percent for home-based work trips (Table 2-3). The First Project Alternatives also see an increase in total daily transit trips over the No Build Alternative by 44,800 to 47,400 trips. The vast majority of these trips are drawn from the highway mode as automobile travel is expected to decrease by 42,600 to 44,800 trips. Of the three First Project Alternatives, the Airport Alternative is projected to experience the highest transit ridership with 272,900 trips, with an increase over the No Build Alternative of more than 47,400 transit trips.

### 2.3.2 Auto and Transit Travel Times

Auto travel times either improve or remain the same under the Fixed Guideway Alternatives, when compared to the No Build Alternative. The most substantial savings in auto travel time occur for trips originating from Waipahu to Downtown and Waikīkī, from Wai'anae to UH Mānoa, from Kapolei to Ala Moana Center, and from 'Ewa to Pearl Harbor. In addition, drive-to-transit trips (i.e., park-and-ride transit trips) provide significant savings from several locations (e.g., Wai'anae, 'Ewa, and Mililani).

Among the Fixed Guideway Alternatives, the Salt Lake Alternative would result in slightly faster travel times from the Leeward side to Downtown because of a shorter alignment through the Salt Lake community – as opposed to traveling past the Airport. The Airport Alternative, in general, shows similar benefits for transit as the Salt Lake Alternative, although it provides significant travel-time savings to destinations such as Pearl Harbor and travel to or from Honolulu International Airport.

## 2.4 Fixed Guideway Salt Lake, Airport, and Airport & Salt Lake – Full Project

### 2.4.1 Mode Share

All of the Full Project Fixed Guideway Alternatives are expected to experience higher systemwide daily transit ridership and mode share in comparison with all of the other alternatives, as shown in Table 2-2. The three Full Project Alternatives are expected to result in transit mode shares of 7.2 percent for daily trips and up to 17.0 percent for home-based work trips (Table 2-3). The Full Project Alternatives also see an increase in total daily transit trips over the No Build Alternative by 53,600 to 56,200 trips and between 8,800 to 8,900 over the First Project Alternative. The vast majority of these trips are drawn from the highway mode as automobile travel is expected to decrease by 49,000 to 51,300 trips. Of the three Full Project Alternatives, the Airport Alternative is projected to experience the highest transit ridership with 281,700 trips, with an increase over the No Build Alternative of more than 56,200 transit trips.

### 2.4.2 Transit Travel Times

Among the Full Project Alternatives, the Salt Lake Alternative would result in slightly faster travel times from the Leeward side to Downtown because of a shorter alignment through the Salt Lake community – as opposed to traveling past the Airport. The Airport Alternative, in general, shows similar benefits for transit as the Salt Lake Alternative, although it provides significant travel-time savings to destinations such as Pearl Harbor and travel to or from Honolulu International Airport. The Full Project provides the shortest travel times to Waikīkī and UH Mānoa.

This section describes the transit ridership effects associated with each of the alternatives. To assist in the analysis of the effects, the ridership figures are summarized for each of the alternatives, in many cases at both the system-wide level and for the 26 Transportation Analysis Areas, as shown in Figure 3-1.

### 3.1 Transit Trips by Time of Day

Table 3-1 presents transit trips by time of day – a.m. two-hour peak period, peak period, off-peak period, and total trips. The a.m. two-hour peak period is from 6:00 to 8:00 a.m. The peak period is from 5:00 to 9:00 a.m. and 2:00 to 6:00 p.m. The table indicates that in the year 2030, the No Build Alternative is expected to carry 225,500 daily transit trips, while the TSM Alternative carries an average of 239,200 daily transit trips. The Fixed Guideway First Project Alternatives carry between 270,200 and 272,800 daily transit trips, a 19.8 to 21.0 percent increase over the No Build Alternative. The Fixed Guideway Full Project Alternatives carry between 279,000 to 281,700 total transit trips, an increase of 23.7 to 24.9 percent over the No Build Alternative.

Overall, the TSM Alternative carries 13,700 additional transit trips over the No Build Alternative. Of this increase, 9,200 are during the peak period and 4,400 are during the off-peak. The larger increase in peak-period trips results from the large increase in peak-period service for the TSM Alternative relative to the No Build Alternative.

The Fixed Guideway First Project Alternatives generate between 44,700 and 47,300 additional transit trips over the No Build Alternative. Of this total increase, between 31,700 and 33,200 trips are during the peak period and between 12,900 and 14,000 are during the off-peak. The a.m. peak-period experiences the largest percentage increase over the No Build Alternative (26.7 to 27.9 percent) indicating that the Fixed Guideway First Project Alternatives attract a high number of transit riders during the critical peaks when the roadways are most congested.

The Fixed Guideway Full Project Alternatives generate between 53,500 and 56,200 additional transit trips over the No Build Alternative. Of this total increase, between 36,700 and 38,300 trips are during the peak period and between 16,700 and 17,800 are during the off-peak. The a.m. peak-period experiences the largest percentage increase over the No Build Alternative (29.6 to 31.1 percent) indicating that the Fixed Guideway Full Project Alternative attracts the highest number of transit riders during the critical peaks when the roadways are most congested.

### 3.2 Transit Trips by Trip Purpose

Table 3-2 summarizes daily transit trips by purpose (home-based work, home-based other, non-home-based, visitor, and total trips) for each of the alternatives. Compared to the No Build Alternative, all trip purposes increase with the TSM Alternative, with increases ranging from 3.0 percent to 7.8 percent more transit trips.

The Fixed Guideway Alternatives (First and Full Projects), however, carry a significantly larger number of transit trips in comparison to both the No Build and TSM Alternatives. The largest increase in transit trips occurs for home-based work trips (29.6 to 30.9 percent for the First Projects and 32.7 to 34.1 percent for the Full Projects). As the majority of work trips occur during the peak periods, the increase in home-based work trips for the Fixed Guideway Alternatives reflects the improved travel times and service during the peak period between residential areas throughout O’ahu and the employment areas in Downtown, Ala Moana, Waikīkī, and UH Mānoa.

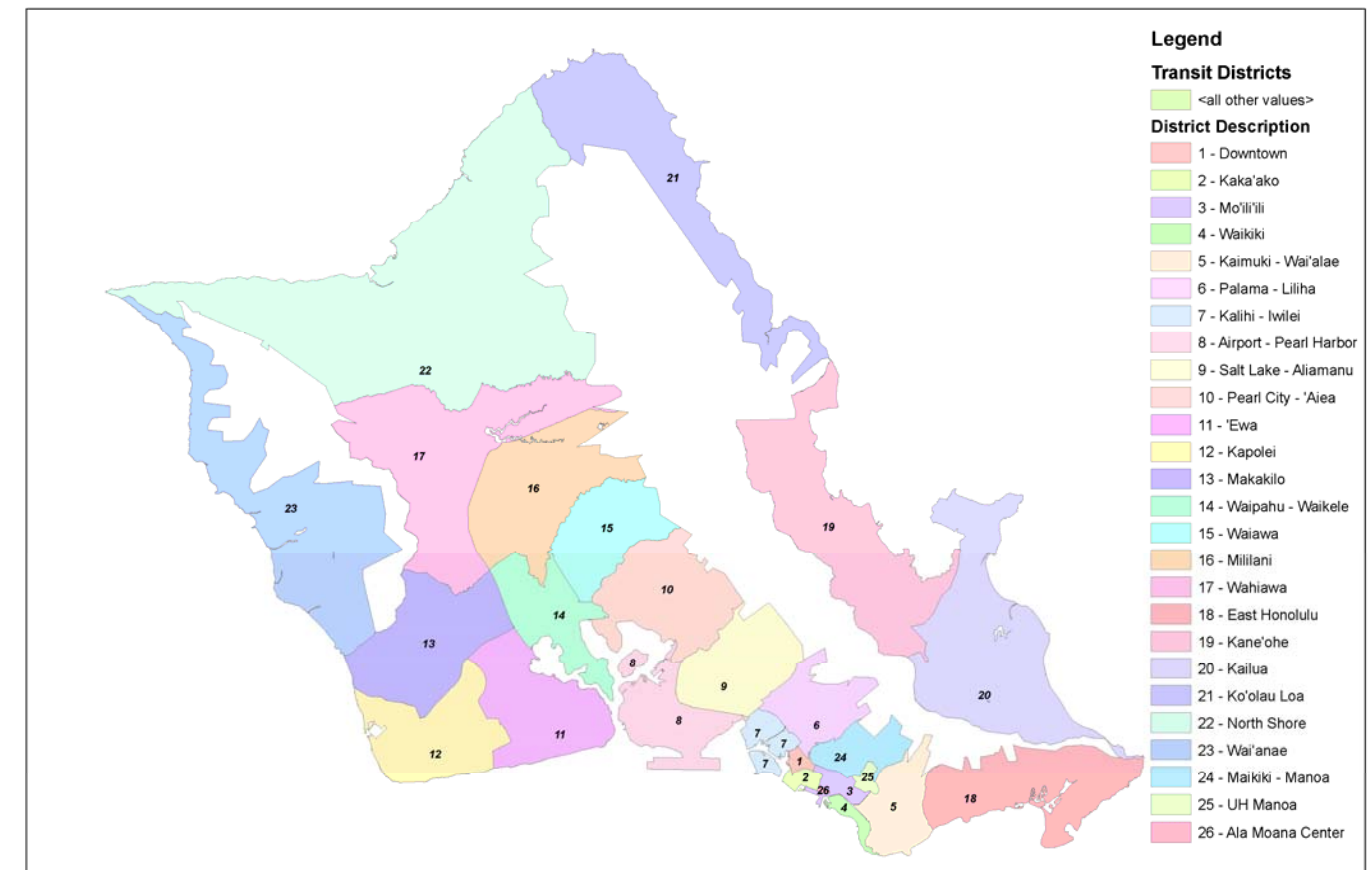

Figure 3-1: Transportation Analysis Area Locations

**Table 3-1. Transit Trips by Time of Day—2030**

Alternative	A.M. 2-Hour Peak	Peak Period	Off-Peak Period	Total Trips <sup>1</sup>
<b>No Build Alternative</b>

<sup>1</sup>Trips added up across all trip purposes may not equal the total due to rounding differences.

### 3.3 Transit Trips by Auto Ownership Level

Table 3-3 summarizes the daily transit trips by auto ownership level for the alternatives being studied. This table does not include visitor trips, because the auto ownership level of visitors has little effect on their choice of mode while on O'ahu. Non-home-based trips are also excluded because the generation of these trips is not dependent on auto ownership.

There is little variation (5 percent) among all of the alternatives in transit trips from the zero-auto households. This is because these households are more transit-dependent and have fewer options for travel regardless of the level of transit service provided.

The TSM Alternative shows a minimal increase over the No Build Alternative one-auto households. There is a larger increase in daily transit trips for zero-auto households (16 percent) and households with two or more automobiles.

Table 3-3 shows that the total number of transit trips increases across all auto ownership categories for the Fixed Guideway Alternatives (First and Full Projects). Transit trips for zero-car households show an increase of 19 to 20 percent (First Project) and 20 to 21 percent (Full Project) over the No Build Alternative. Substantial increases are seen for households with two or more autos (79 to 80 percent (First Project) and 83 to 84 percent (Full Project)). This increase in ridership at higher levels of auto ownership indicates that the Fixed Guideway Alternatives are more attractive to those who have multiple options for travel.

**Table 3-3. Daily Transit Trips by Auto Ownership Levels—2030**

Alternative	Zero Autos Per Household	One Auto Per Household	Two or More Autos Per Household	Total
<b>No Build Alternative</b>				
Number of Daily Transit Trips	56700	52200	44500	153400

% Change from No Build	21%	26%	83%	40%

### 3.4 Transit Trip Differences: No-Build versus TSM Alternative

The patronage results for the No Build Alternative for daily, peak-period, and off-peak-period trips are summarized in Table 3-4 through Table 3-6, respectively. The daily trip tables are further summarized by trip purpose in Table 3-7 through Table 3-10, showing home-based work, home-based other, non-home based, and visitor trips, respectively.

The results for the TSM Alternative for daily, peak, and off-peak trips are summarized in Table 3-11 through Table 3-13, respectively. The TSM Alternative daily trip table is summarized by trip purpose (work, non-work, non-home based, and visitor) in Table 3-14 through Table 3-17, respectively. The differences in ridership generated between the two alternatives are summarized in Table 3-18 through Table 3-20 for daily, peak, and off-peak periods, respectively. The differences in daily ridership by purpose are shown in Table 3-21 through Table 3-24 for work, non-work, non-home based, and visitor trips, respectively.

The TSM Alternative is projected to carry 13,700 more daily transit trips than the No Build Alternative, with 9,200 in the peak period and 4,400 in the off-peak. The majority of these additional trips are short trips within areas outside of the Primary Urban Center. The TSM Alternative is also expected to result in 6,500 more transit home-based work trips than the No Build Alternative. Many of these trips will be within Central O‘ahu, Kapolei, and ‘Ewa, where more local bus routes would attract additional local transit trips. The TSM Alternative would also attract 4,700 more home-based other trips than the No Build Alternative. Again, most of these added trips would be outside of the Primary Urban Center.

The 1,900 non-home-based trips that the TSM Alternative adds to the No Build Alternative would be distributed throughout the island. There is a minimal difference in visitor transit trips between these two alternatives (670 trips).

### 3.5 Transit Trip Differences: No Build versus Fixed Guideway First Project Salt Lake Alternative

The patronage results for the Fixed Guideway Salt Lake Alternative for daily, peak period and off-peak-period trips are summarized in Table 3-25 through Table 3-27, respectively. The breakdown of daily transit trips by trip purpose is seen in Table 3-28 through Table 3-31 for home-based work, home-based other, non-home based, and visitor trips, respectively. The differences in ridership between the First Project Salt Lake Alternative and the No Build Alternative are summarized in Table 3-32 through Table 3-34 for daily, peak, and off-peak periods, respectively. The differences between the First Project Salt Lake Alternative and the No Build Alternative for work, non-work, non-home based, and visitor trips are shown in Table 3-35 through Table 3-38, respectively. This alternative has the lowest ridership of the three First Project Alternatives.

One of the primary benefits provided by the First Project Salt Lake Alternative is the travel-time savings for trips from ‘Ewa and Central O‘ahu to employment sites in the Downtown, Kapolei, and Pearl City/Aiea areas during peak periods. This time savings results in the First Project Salt Lake Alternative carrying approximately 24,390 more home-based work transit riders than the No Build Alternative.

The First Project Salt Lake Alternative also results in approximately 12,450 additional home-based other transit trips as compared to the No Build Alternative. About 21 percent of these trips have UH Mānoa as the attraction, which is the eastern terminus for the Full Project Fixed Guideway Alternatives.

Additionally, the 4,810 more non-home-based transit trips projected for First Project Salt Lake Alternative as compared to the No Build Alternative occur primarily to, from, and within the Salt Lake, Pearl City/'Aiea, 'Ewa, and Kapolei areas.

There is relatively little difference in transit visitor trips between the First Project Salt Lake Alternative and the No Build Alternative.

### **3.6 Transit Trip Differences: No Build versus Fixed Guideway First Project Airport Alternative**

The patronage results for the Fixed Guideway First Project Airport Alternative for daily, peak period, and off-peak-period trips are summarized in Table 3-39 through Table 3-41, respectively. The breakdown of daily transit trips by trip purpose is seen in Table 3-42 through Table 3-45 for home-based work, home-based other, non-home based, and visitor trips, respectively. The differences in ridership between the First Project Airport Alternative and the No Build Alternative are summarized in Table 3-46 through Table 3-48 for daily, peak, and off-peak periods, respectively. The differences between First Project Airport Alternative and the No Build Alternative for work, non-work, non-home based, and visitor trips are shown in Table 3-49 through Table 3-52, respectively. This alternative has the highest ridership of the three First Project Alternatives.

One of the most significant benefits provided by the First Project Airport Alternative is the travel-time savings for trips from 'Ewa and Central O'ahu to employment sites in the Downtown, Kapolei, and Pearl City/'Aiea areas during peak travel periods. As a result, the First Project Airport Alternative is projected to carry approximately 25,410 more home-based work transit riders than the No Build Alternative.

The First Project Airport Alternative also results in an additional 12,590 home-based other transit trips as compared to the No Build Alternative. About 20 percent of these trips have UH Mānoa as the attraction, which is the eastern terminus for the Fixed Guideway Full Project Alternative.

Additionally, the 5,410 more non-home-based transit trips projected for the First Project Airport Alternative as compared to the No Build Alternative occur primarily to, from, and within the Salt Lake/Airport, Pearl City/'Aiea, 'Ewa, and Kapolei areas.

There is relatively little difference in transit visitor trips between the First Project Airport Alternative and the No Build Alternative. However, the First Project Airport Alternative provides approximately 900 more visitor trips than the First Project Salt Lake Alternative.

### **3.7 Transit Trip Differences: No Build versus Fixed Guideway Alternative First Project Airport & Salt Lake Alternative**

The patronage results for the First Project Airport & Salt Lake Alternative for daily, peak period, and off-peak-period trips are summarized in Table 3-53 through Table 3-55, respectively. The breakdown of daily transit trips by trip purpose is seen in Table 3-56 through Table 3-59 for home-based work, home-based other, non-home based, and

visitor trips, respectively. The differences in ridership between the First Project Airport & Salt Lake Alternative and the No Build Alternative are summarized in Table 3-60 through Table 3-62 for daily, peak, and off-peak periods, respectively. The differences between the First Project Airport & Salt Lake Alternative and the No Build Alternative for work, non-work, non-home based, and visitor trips are shown in Table 3-63 through Table 3-66, respectively.

One of the most significant benefits provided by the First Project Airport & Salt Lake Alternative is the travel-time savings for trips from 'Ewa and Central O'ahu to employment sites in the Downtown, Kapolei, and Pearl City/'Aiea areas during peak travel periods. As a result, this option carries 24,840 more home-based work transit riders than the No Build Alternative.

The First Project Airport & Salt Lake Alternative also results in an additional 12,390 home-based other transit trips as compared to the No Build Alternative. About 20 percent of these have UH Mānoa as the attraction, which is the eastern terminus for this Fixed Guideway Full Project Alternative.

Additionally, the 5,250 more non-home-based transit trips projected for the First Project Airport & Salt Lake Alternative as compared to the No Build Alternative occur primarily to, from, and within the Salt Lake/Airport, Pearl City/'Aiea, 'Ewa, and Kapolei areas.

There is relatively little difference in transit visitor trips between the First Project Airport & Salt Lake Alternative and the No Build Alternative.

### **3.8 Transit Trip Differences: No Build versus Fixed Guideway Alternative Full Project Salt Lake Alternative**

The patronage results for the Fixed Guideway Full Project Salt Lake Alternative for daily, peak period, and off-peak-period trips are summarized in Table 3-67 through Table 3-69, respectively. The breakdown of daily transit trips by trip purpose is seen in Table 3-70 through Table 3-73 for home-based work, home-based other, non-home based, and visitor trips, respectively. The differences in ridership between the Full Project Salt Lake Alternative and the No Build Alternative are summarized in Table 3-74 through Table 3-76 for daily, peak, and off-peak periods, respectively. The differences between the Full Project Salt Lake Alternative and the No Build Alternative for work, non-work, non-home based, and visitor trips are shown in Table 3-77 through Table 3-80, respectively.

One of the most significant benefits provided by the Full Project Salt Lake Alternative is the travel-time savings for trips from 'Ewa and Central O'ahu to employment sites in the Downtown, Kapolei, and Pearl City/'Aiea areas along the alignment. This time savings is the primary reason this alternative carries 26,930 more home-based work transit riders than the No Build Alternative.

The Full Project Salt Lake Alternative also results in approximately 13,840 additional home-based other transit trips as compared to the No Build Alternative. About 20 percent of these have UH Mānoa as the attraction, which is the eastern terminus for this alternative.

Additionally, the 5,590 more non-home-based transit trips projected for the Full Project Salt Lake Alternative as compared to the No Build Alternative occur primarily to, from, and within the Salt Lake/Airport, Pearl City/'Aiea, and Kapolei areas.

Approximately 6,780 additional visitor transit trips are projected for this alternative as compared to the No Build Alternative. This is approximately twice the number of visitor transit trips projected under any of the First Project Alternatives.

### **3.9 Transit Trip Differences: No Build versus Fixed Guideway Alternative Full Project Airport Alternative**

The patronage results for the Fixed Guideway Full Project Airport Alternative for daily, peak period, and off-peak-period trips are summarized in Table 3-81 through Table 3-83, respectively. The breakdown of daily transit trips by trip purpose is seen in Table 3-84 through Table 3-87 for home-based work, home-based other, non-home based, and visitor trips, respectively. The differences in ridership between the Full Project Airport Alternative and the No Build Alternative are summarized in Table 3-88 through Table 3-90 for daily, peak, and off-peak periods, respectively. The differences between the Full Project Airport Alternative and the No Build Alternative for work, non-work, non-home based, and visitor trips are shown in Table 3-91 through Table 3-94, respectively.

One of the most significant benefits provided by the Full Project Airport Alternative is the travel-time savings for trips from 'Ewa and Central O'ahu to employment sites in the Downtown, Kapolei, and Pearl City/'Aiea areas along the alignment. This time savings is the primary reason this alternative carries 28,070 more home-based work transit riders than the No Build Alternative.

The Full Project Airport Alternative also results in approximately 13,940 additional home-based other transit trips as compared to the No Build Alternative. About 19 percent of these have UH Mānoa as the attraction, which is the eastern terminus for this alternative.

Additionally, the 6,490 more non-home-based transit trips projected for the Full Project Airport Alternative as compared to the No Build Alternative occur primarily to, from, and within the Salt Lake/Airport, Pearl City/'Aiea, 'Ewa, and Kapolei areas.

Approximately 7,760 additional visitor transit trips are projected for this alternative as compared to the No Build Alternative. This is approximately twice the number of visitor transit trips projected under any of the First Project Alternatives.

### **3.10 Transit Trip Differences: No Build versus Fixed Guideway Alternative Full Project Airport & Salt Lake Alternative**

The patronage results for the Fixed Guideway Full Project Airport & Salt Lake Alternative for daily, peak period, and off-peak-period trips are summarized in Table 3-95 through Table 3-97, respectively. The breakdown of daily transit trips by trip purpose is seen in Table 3-98 through Table 3-101 for home-based work, home-based other, non-home based, and visitor trips, respectively. The differences in ridership between

the Full Project Airport & Salt Lake Alternative and the No Build Alternative are summarized in Table 3-102 through Table 3-104 for daily, peak, and off-peak periods, respectively. The differences between the Full Project Airport & Salt Lake Alternative and the No Build Alternative for work, non-work, non-home based, and visitor trips are shown in Table 3-105 through Table 3-108, respectively.

One of the most significant benefits provided by the Full Project Airport & Salt Lake Alternative is the travel-time savings for trips from 'Ewa and Central O'ahu to employment sites in the Downtown, Kapolei, and Pearl City/'Aiea areas along the alignment. This time savings is the primary reason this alternative carries 27,450 more home-based work transit riders than the No Build Alternative.

The Full Project Airport & Salt Lake Alternative also results in approximately 13,830 additional home-based other transit trips as compared to the No Build Alternative. About 19 percent of these have UH Mānoa as the attraction, which is the eastern terminus for this alternative.

Additionally, the 6,190 more non-home-based transit trips projected for the Full Project Airport & Salt Lake Alternative as compared to the No Build Alternative occur primarily to, from, and within the Salt Lake/Airport, Pearl City/'Aiea, 'Ewa, and Kapolei areas.

Approximately 7,865 additional visitor transit trips are projected for this alternative as compared to the No Build Alternative. This represents the highest increase in visitor transit trips for any of the alternatives studied.

This section describes the projected ridership effects on the transit facilities for the year 2030 Alternatives.

### 4.1 Transit Line Volumes

Table 4-1 through Table 4-8 display the transit route summaries for the year 2030 No Build, TSM, and six Fixed Guideway Alternatives, respectively. This information includes the projected number of transit boardings and passenger miles by route for the peak, off-peak, and 24-hour periods (complete tables with routes by direction and maximum load points are available in Appendix A). The No Build Alternative would handle 314,300 daily boardings on local buses, express buses, and ferry. This alternative would result in 1,751,000 passenger miles of daily bus/ferry travel. The TSM Alternative is projected to experience 346,100 daily bus and ferry boardings, resulting in 1,905,300 passenger miles of daily bus/ferry travel.

The Fixed Guideway First Project Salt Lake Alternative would handle 87,600 daily fixed guideway boardings resulting in 879,700 passenger miles of daily travel on the fixed guideway. This alternative would also handle 361,800 daily boardings on buses, resulting in a daily total of 1,525,200 passenger-miles of bus travel.

The Fixed Guideway First Project Airport Alternative would handle 95,300 daily fixed guideway boardings, resulting in 929,900 passenger miles of daily travel on the fixed guideway. Additionally, this alternative would handle 354,300 daily boardings on buses, resulting in a daily total of 1,506,900 passenger-miles of bus travel. This alternative has the highest number of daily fixed guideway boardings and passenger miles when compared to the other First Project Alternatives.

The Fixed Guideway First Project Airport & Salt Lake Alternative would handle 92,700 daily fixed guideway boardings, resulting in 889,800 passenger miles of daily travel on the fixed guideway. This alternative would also handle 353,400 daily boardings on buses, resulting in a daily total of 1,503,200 passenger-miles of bus travel.

The Fixed Guideway Full Project Salt Lake Alternative would handle 111,700 daily fixed guideway boardings, resulting in 1,098,000 passenger miles of daily travel on the fixed guideway. This alternative also handles 334,300 daily boardings on buses, resulting in a daily total of 1,403,600 passenger-miles of bus travel.

The Fixed Guideway Full Project Airport Alternative would handle 119,600 daily fixed guideway boardings, resulting in 1,152,900 passenger miles of daily travel on the fixed guideway. Additionally, there would be 327,800 daily boardings on buses, resulting in a daily total of 1,384,300 passenger-miles of bus travel. This alternative has the highest number of daily fixed guideway boardings when compared to the other fixed guideway alternatives.

The Fixed Guideway Full Project Airport & Salt Lake Alternative would handle 118,400 daily fixed guideway boardings, resulting in 1,124,500 passenger miles of daily travel on the

fixed guideway. This alternative would also handle 326,700 daily boardings on buses, resulting in a daily total of 1,382,400 passenger-miles of bus travel.

### 4.2 Station Volumes by Access Modes

Table 4-9 through Table 4-14 summarize the a.m. peak-hour fixed guideway mode of arrival and departure at each of the stations for the six Fixed Guideway Alternatives. For all of the Fixed Guideway Alternatives, the primary mode of access to the stations overall was via bus, indicating the integration with and reliance on bus connections to the fixed guideway line to serve the greater study corridor.

The Full Project Alternatives show that approximately 60 percent of the fixed guideway riders in the a.m. peak hour would access the system by transferring from a feeder bus while 70 percent would do the same for the First Project Alternatives. Approximately 20 percent of these bus-to-rail transfers would occur at the Pearl Highlands terminal station in each Fixed Guideway Alternative. Other significant transfer stations in the First Project Alternatives would be UH West O'ahu, East Kapolei, and West Loch. Bus transfers greatly decrease at the East Kapolei Station under the Full Project Alternatives since this station is no longer the terminus of the fixed guideway system.

Under the First Project Alternatives, approximately 15 percent of fixed guideway riders access stations via walking during the a.m. peak hour. This percentage increases to 22-23 percent under the Full Project Alternatives. About 15 percent of walking trips under the First Project access the fixed guideway system at Pearl Highlands, although trips are relatively equally distributed throughout the system. Under the Full Project Alternatives, mode of access via walking is highest at Pearl Highlands, Liliuokalani Avenue, and the Convention Center. Between 14.5 and 16 percent of all riders would access the system via automobile (either via kiss-and-ride drop off, park-and-ride lots, or spillover parking) under both the First and Full Project Alternatives.

Regarding mode of departure, the primary mode used for each of the six Fixed Guideway Alternatives was walking. This is because most of the large employment areas are concentrated along the fixed guideway alignments, while residential housing areas are more evenly spread throughout the island. Under the First Project Alternatives, 50 to 54 percent of fixed guideway riders depart via walking. This percent grows significantly under the Full Project Alternatives to 71 to 74 percent. More riders depart fixed guideway stations via bus under the First Project, which reflects the fact that the First Project Alternatives would rely more heavily on integration with the bus system, particularly at its termini stations.

### 4.3 Fixed Guideway Link Volumes

The projected link volumes between the transit stations for the six Fixed Guideway Alternatives are listed in Table 4-15 through Table 4-20.

The heaviest daily volumes are found between the following stations:

- First Project, Salt Lake Alternative: Kalihi and Kapālama
- First Project, Airport Alternative: Lagoon Drive and Middle Street
- First Project, Airport & Salt Lake Alternative: Kalihi and Kapālama
- Full Project, Salt Lake Alternative: Kalihi and Kapālama
- Full Project, Airport Alternative: Kalihi and Kapālama
- Full Project, Airport & Salt Lake Alternative: Pearl Highlands and Pearlridge

These links are forecasted to carry from 40,500 to 41,800 daily rail riders for the three First Project Alternatives and between 37,900 and 45,000 daily rail riders for the three Full Project Alternatives.

The maximum one-way peak-hour volume is found between the following stations:

- First and Full Project, Salt Lake Alternative: Ala Liliko'i and Middle Street
- First and Full Project, Airport Alternative: Aloha Stadium (Kamehameha Highway) and Pearl Harbor
- First Project, Airport & Salt Lake Alternative: Middle Street and Kalihi
- Full Project, Airport & Salt Lake Alternative: Pearl Highlands and Pearlridge

Volumes range from 5,900 to 6,600 passengers during the peak hour in the peak direction (Koko Head-bound) under the First Project Alternatives. Under the Full Project Alternatives, volumes range from 6,280 to 6,860 passengers during the peak hour in the peak direction.

The a.m. peak-hour link volumes on the rail transit line are graphically displayed in Figure 4-1 through Figure 4-6. These figures show that eastbound trains would carry the greatest number of passengers in the morning. On the 'Ewa side of the transit corridor, the peak direction (Koko Head-bound) accounts for more than 90 percent of the ridership. Peak direction ridership drops off dramatically after the Downtown stops, and the volume entering the Downtown area is nearly 80 percent of the volume near the Pearl Highlands Station (Kamehameha Highway/Kuala Street). This is reflective of the high number of riders traveling from 'Ewa and Central O'ahu to the Primary Urban Center, accessing the stations on the Leeward side by either feeder bus or park-and-ride lots.

#### **4.4 Station-to-Station Volumes**

Table 4-21 through Table 4-24 display the ridership projections for each station-to-station pair for the daily transit trips. These matrices show that the largest station-to-station interchange volumes are those between the Pearl Highlands Station, Downtown, Ala Moana Center, and UH Mānoa.

**Table 4-1. Transit Boardings and Passenger-Miles by Route—2030 No Build Alternative**

## ***Appendix A Statistics for All Alternatives Evaluated***

**Table A-1. System Wide Transit Summary by Alternative**

<b>Year</b>	<b>Total transit trips</b>	<b>Transit Mode Share</b>	<b>Fixed Guideway</b>	<b>Total Boardings</b>
2007 Base Year	183526	5.8%	n/a	251430
2030 NoBuild	225513	5.8%	n/a	314321
2030 TSM	239205	6.2%	n/a	346086
2030 First Project Salt Lake	270255	7.0%	87571	449446
2030 First Project Airport	272845	7.0%	95305	449736
2030 First Project Airport and Salt Lake	271892	7.0%	92707	446168
2030 Full Build Salt Lake	279010	7.2%	111715	446082
2030 Full Build Airport	281771	7.3%	119558	447391
2030 Full Build Airport and Salt Lake	280843	7.2%	118431	445141

## ***Appendix B Transit User Benefits Comparison***

**Table B-1. Transit User Benefit Summary by Alternative**

<b>Alternative</b>	<b>Total</b>
2030 First Project Salt Lake Alternative	16,246,000
2030 First Project Airport Alternative	17,043,000
2030 First Project Airport and Salt Lake Alternative	16,643,000
2030 Full Build Salt Lake Alternative	20,521,000
2030 Full Build Airport Alternative	20,971,000
2030 Full Build Airport and Salt Lake Alternative	20,538,000
